Table of down- and up-regulated genes of strains CVt $\Delta$ 2 after 12h, 24h and 48h cultivation. The first value represents the regulation difference observed and the second value is the inverse value of expression in the replicate dye swap experiment. If more than two values appear, the others are replicates on the microarray slide. Down-regulated values are shown in green and up-regulated values in red. jgiTre2 = gene number from the second round sequencing of *T. reesei* genome.

Table of down- and up-regulated genes of strains CVtΔ4 after 12h, 24h and 48h cultivation. The first value represents the regulation difference observed and the second value is the inverse value of expression in the replicate dye swap experiment. If more than two values appear, the others are replicates on the microarray slide. Down-regulated values are shown in green and up-regulated values in red. jgiTre2 = gene number from the second round sequencing of *T. reesei* genome.

Table of down- and up-regulated genes of strains CVtΔ5 after 12h, 24h and 48h cultivation. The first value represents the regulation difference observed and the second value is the inverse value of expression in the replicate dye swap experiment. If more than two values appear, the others are replicates on the microarray slide. Down-regulated values are shown in green and up-regulated values in red. jgiTre2 = gene number from the second round sequencing of *T. reesei* genome.

Table of down- and up-regulated genes of strains Rut-C30, CVt and CVt $\Delta$ 4 at 48h growth under proteasome inhibition conditions. The first value represents the regulation difference observed and the second value is the inverse value of expression in the replicate dye swap experiment. If more than two values appear, the others are replicates on the microarray slide. Down-regulated values are shown in green and up-regulated values in red. jgiTre2 = gene number from the second round sequencing of *T. reesei* genome.
